

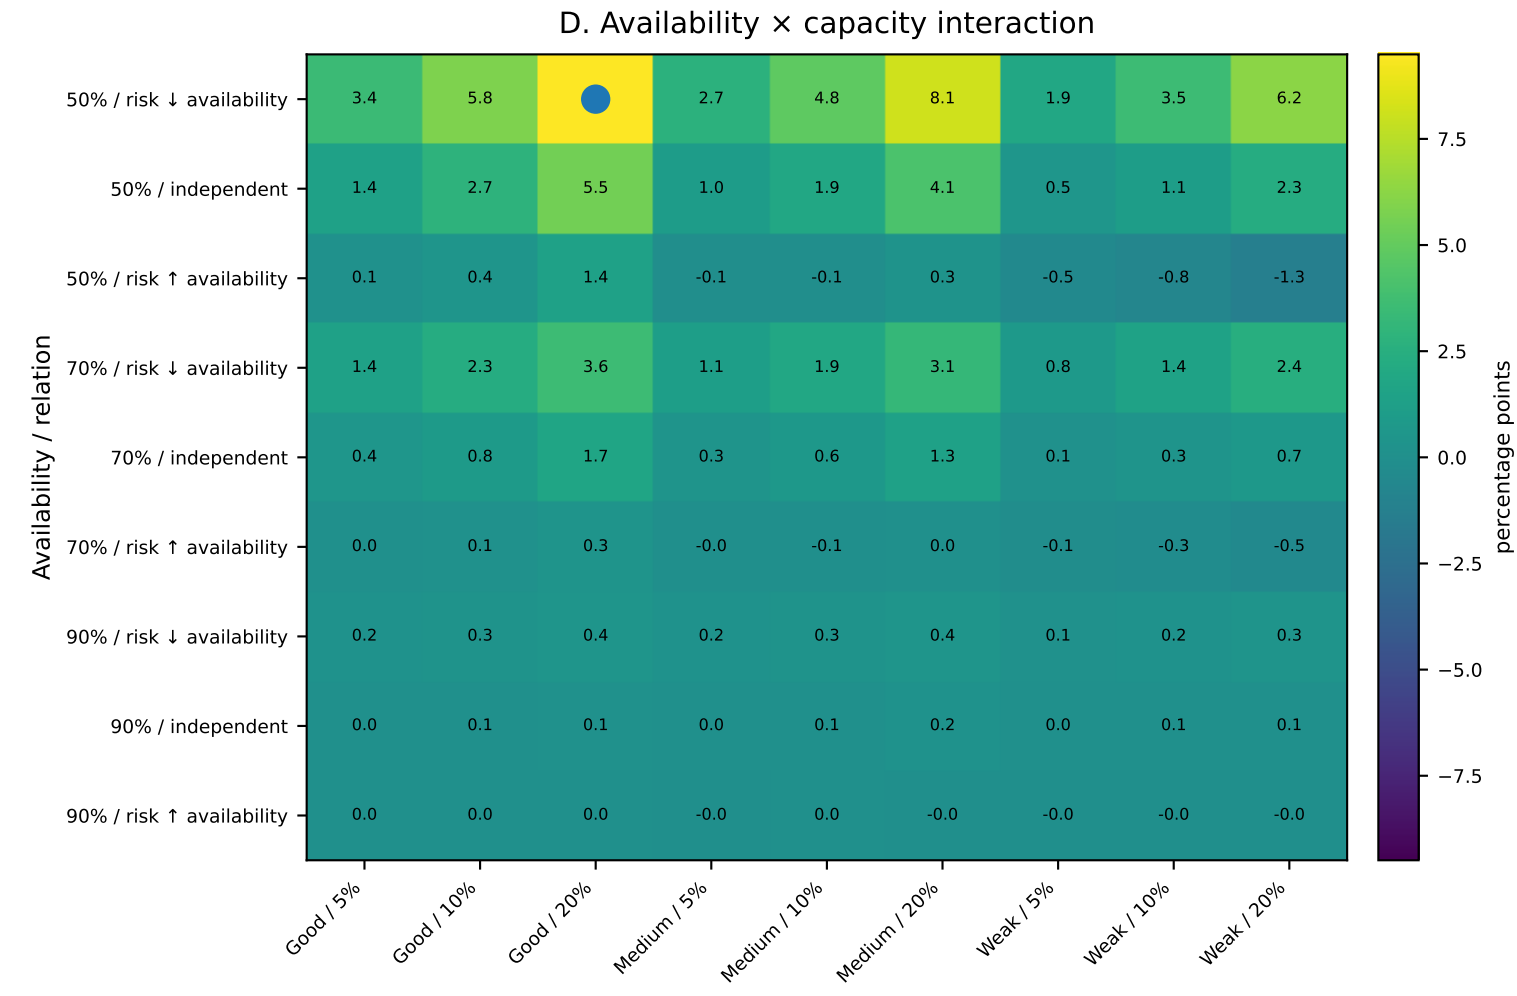

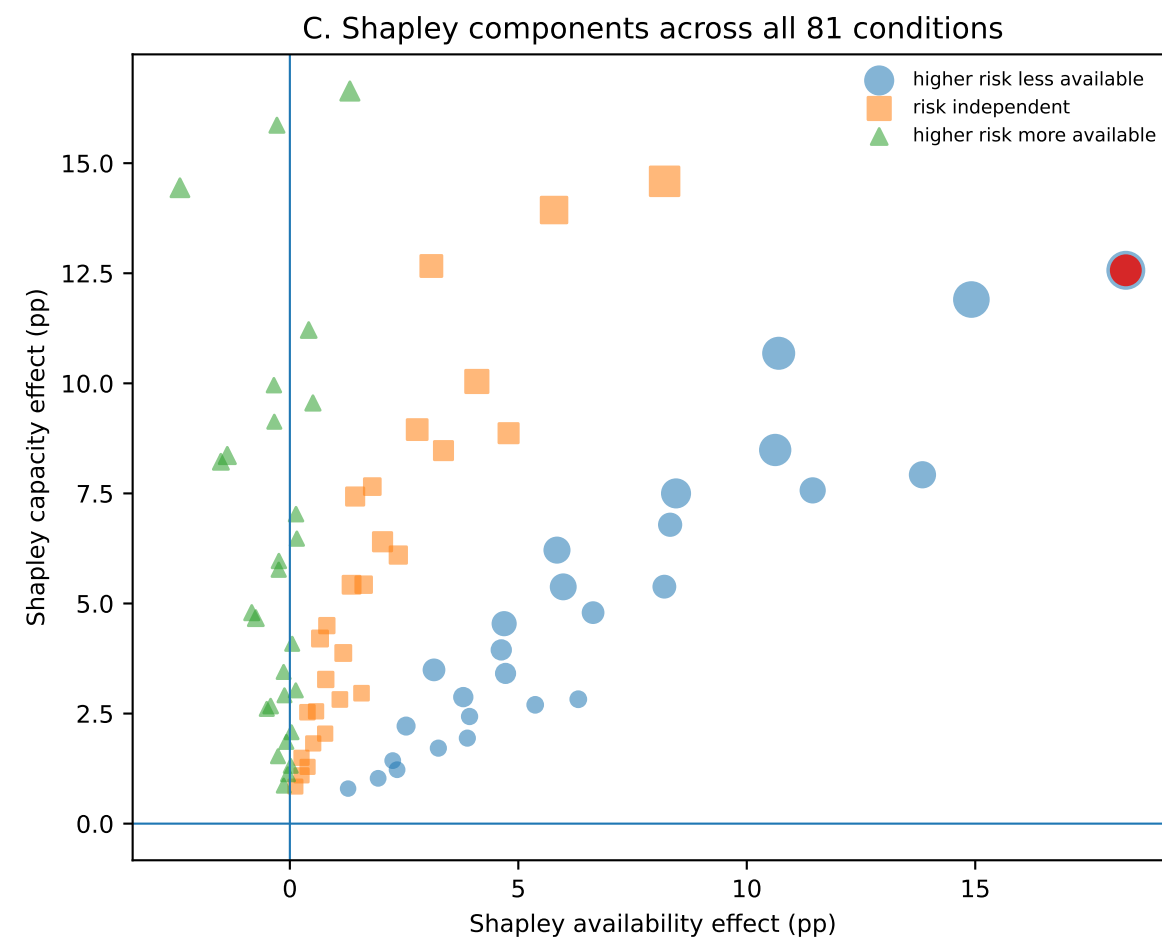

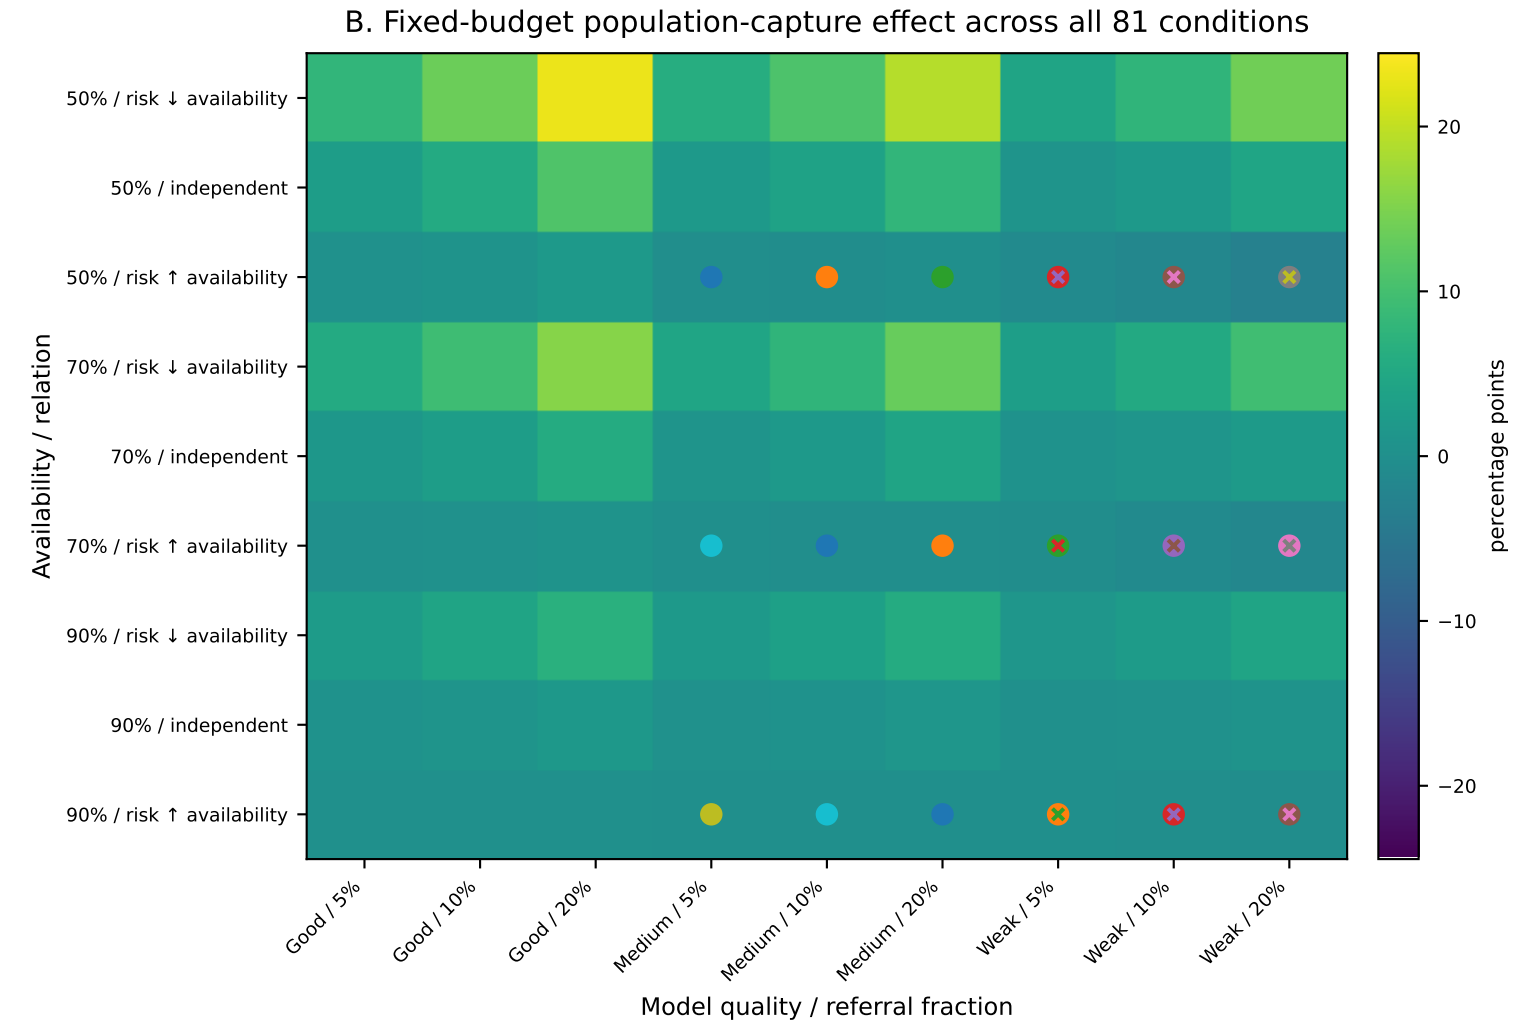

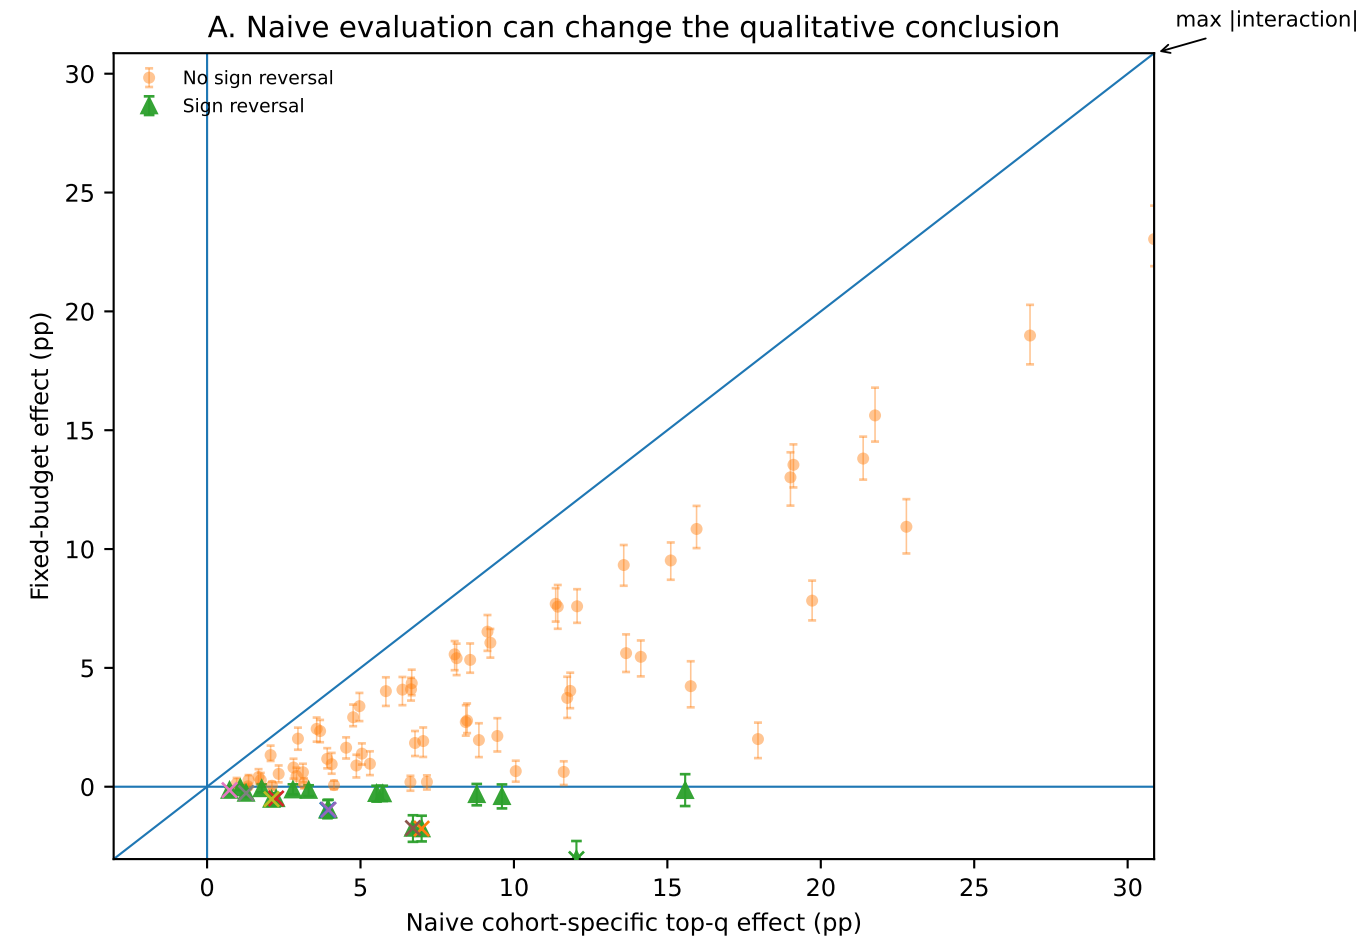

Figure 3. Synthetic stress test of cohort-specific top-q evaluation

Each point/cell is one of 81 conditions (3 availability levels × 3 availability–outcome relations × 3 model-quality levels × 3 referral fractions). Error bars and intervals are empirical 95% simulation intervals across replicates. Fixed-budget effect is C11 – C01; naive top-q effect is C01 – C00. Points above the diagonal in A are naive > 0 but fixed-budget < 0; crosses mark fixed-budget intervals entirely below zero. Point size in panel C scales with |interaction|.
